The driving-power was found to be 0.0069 watt; therefore the motor efficiency =0.066 per cent. Current in Secondary Coil.--The current in the shortcircuited secondary coil could not be measured directly. Calculating from the dimensions of the coil, however, the resistance was found to be 8.5×10^{-6} ohm. From this and the value of the power (0.40 watt) we find that the secondary current attains the extraordinary value of 220 amperes. For the sake of comparison some of the above results are collected in Table IV. Table IV. In conclusion, it will be noticed that in motor meters the driving-flux density is of the order 100 and the brake B from 500 to 1000; also that the motor efficiencies are all very small, particularly in the case of the alternating-current meters. In all of...
